

# FCC Reporting Packet

In Response to the FCC Public Notice issued  
November 7, 2005

Provided to the FCC relevant to  
Customers of  
“Telefinity Dash 911”

Includes

- Body of Letter
- Map – Basic PSAP Coverage
- Map – Major Market Rollout Coverage
- Spreadsheet showing detail Coverage & Rollout Plan

November 28<sup>st</sup>, 2005

*Provided based on information supplied by Intrado Corporation and  
is not to be used for any other purpose other than filing Compliance*

## Overview:

In an effort to continue supporting our customers as they seek to adhere to the Federal Communications Commission's (FCC) reporting requirements, Telefinity Dash911, based on information provided to us by our backbone/service provider Intrado Corporation, has prepared the following document that contains key reporting elements and deployment information as requested by the FCC in its Public Notice entitled, *Enforcement Bureau Outlines Requirements of November 28, 2005 Interconnected Voice Over Internet Protocol 911 Compliance Letters*, WC Docket No. 04-36, WC Docket No. 05-196, released on November 7, 2005 (Public Notice).

The information set forth in this document is intended to provide information to the FCC so that the FCC may have further knowledge of the 9-1-1 service and support that Telefinity Corporation/Dash911 Solutions is providing to smaller VSPs. A majority of this information was also supplied to our customer VSPs to use to supplement the Compliance Report that VoIP Service Providers (VSPs) were required to file with the FCC by November 28, 2005. The format of the document is in alignment with the Public Notice, in order to facilitate an easier reporting transition for the VSPs. In addition, the actual filing procedures from the Public Notice are provided at the end of this document to further assist our customer VSPs.

We are willing to accept written questions that the FCC would like to submit to us regarding our services. We would particularly like to open a dialog on how to provide a sort of "safe harbor" to VSPs who have signed on with a service such as Intrado or Dash911 so that they can continue to market their VoIP services so long as they have a responsible 9-1-1 service provider. As a country we certainly should not preclude a person from having the latest technology simply based on whether or not he has E911 or Basic 911; after all, there are many telephone subscribers in the USA who do not now have and will not have anytime soon "E" 911.

Sincerely,  
Gregory Giagnocavo, Pres  
Telefinity Dash911

**\*\*Note:** Please view document in Print Layout and open the maps using Adobe Acrobat Reader. The maps were prepared by Intrado at high resolution, so you can zoom in on any specific county in any state. The county information is the most detailed information available via the map. For more specific information please refer to the enclosed spreadsheet.

### **Our 911 Solution:**

The V9-1-1™ solution enabled by Telefinity Dash911 through Intrado provides a true E9-1-1 solution for VoIP Service Providers. The solution provided by the Telefinity Dash911 affiliation with Intrado enables a comprehensive approach to delivering E9-1-1 for VoIP by handling all aspects of the VoIP 9-1-1 call delivery and VoIP Positioning Center (VPC) functionality such as Master Street Address Guide (MSAG) Address Validation, ESQK management, Geocoding, real-time provisioning and routing determination.

Included in the Service for the VSP is also the call delivery component to ensure the 9-1-1 call reaches the appropriate selective router and Public Safety Answering Point (PSAP). Specifically, Intrado manages the VPC functionality and the Call Delivery component on behalf of Telefinity Dash 911 thereby enabling VSPs to take advantage of a full end-to-end solution from one E911 service provider.

The only VSP requirements for delivery of the V9-1-1 service are the ongoing delivery of address and telephone number information to Telefinity Dash911 via a real-time interface and the PSTN connectivity to the Telefinity Dash911 network to enable live 9-1-1 call delivery. The real-time interface is via a SOAP API programming interface supplied by Telefinity Dash 911 to its VSP customers, or, a branded website interface provided by Telefinity Dash911 to its VSP customers.

- **911 Routing Information/Connectivity to Wireline E911 Network:**

Currently through the assistance of our Network providers, each of Telefinity Dash911's VSP customers will have access to 154 E9-1-1 Selective Routers by November 28<sup>th</sup>, 2005 and the attached "Major Market Deployment Map" and the "VoIP Deployment Plan" reflects the major market deployment schedules. Note: the market deployment map represent major markets where Intrado has reported to Telefinity Dash911 that it has connectivity to at least 1 selective router, ALI steering and the ability to populate ALI.

- **Transmission of ANI and Registered Location Information:**

**All of our VSP customers must pass tests to assure that they can accurately and consistently pass the ANI to our system with every 9-1-1 call placed by a subscriber.**

**Each of our VSPs are enabled to provide Registered Location Information for each of their subscribers. We provide to the VSP a SOAP API programming interface as well as an online website provisioning system.**

- **Basic PSAP:** Currently 93% of the US population is served by PSAPs operating off an E9-1-1 Selective Router. To illustrate PSAPs within the US, which are not served by a Selective Router, the enclosed "Basic 9-1-1 PSAP" map could be used as reference information. While these areas are not included within the FCC Order and are not required for compliance, Intrado reports that they are actively contacting these areas to determine technical options for VoIP E9-1-1 native call delivery.

- **ANI Only:** There are unique deployment circumstances in areas of the US and Puerto Rico that operate off E9-1-1 Selective Routers, but will not meet the full FCC mandate.
- Telefinity Dash911 has indicated that Intrado has noted that there are currently four (4) States and a Territory that will have native Selective Routing functionality but will only provide Automatic Number Identification (ANI) only service to the PSAP. The following information explains the circumstances within these areas:

**New Jersey** - In the State of New Jersey Intrado has obtained permission from the State to deploy a voice-only service which includes the call-taker receiving ANI on the VoIP 911 caller. The State ALI system is not capable of full dynamic ALI updates and will require an upgrade. New Jersey represents 3% of the total US population.

**Ohio** - To date, Ohio has not granted permission to Intrado to deploy a voice-only solution. The State ALI system is not capable of full dynamic ALI update. Ohio represents 4% of the total US population.

**Hawaii** - To date, Hawaii has not granted Intrado permission to deploy a voice-only solution. The ALI systems serving Hawaii are not capable of full dynamic ALI update. Hawaii represents 5% of the total US population

**Puerto Rico** - To date, Puerto Rico has not granted permission to Intrado to deploy a voice-only solution. The ALI systems are not capable of full dynamic ALI update. Puerto Rico represents 3% of the total US population

- **VSP Specific Metrics:** Please see enclosed VSP coverage Spreadsheet.

○ **911 Coverage:**

Each and every one of the VSPs using our Dash911 service offering will have the full coverage provided by Intrado as and when that coverage is available. The VSP will not have to do any further programming or take any further steps. As and when the Intrado roll-out is effectuated, all of our VSP customers will have full access to the Intrado market map.

- **Deployment Overview** – The Telefinity Dash 911 E911 solution uses Intrado as a backbone supplier and as such Intrado is the VPC and is working on nationwide native VoIP E9-1-1 delivery in accordance with the Commission Order. The initial PSAP deployments are targeted in major metropolitan areas throughout the US based on the VSP customer subscriber base priorities. The attached *“Major Market Deployment Map”*, which corresponds with MSAs, identifies regions within our subscriber territory that have connectivity to at least one Selective Router, ALI steering capabilities; ANI and the ability to populate ALI. Telefinity Dash 911 has advised us that these areas are planned for deployments by November 28, 2005; March 31, 2006 and June 30,

2006. This intention of this map is to demonstrate FCC compliance for the November 28<sup>th</sup> requirements and the future deployment strategy.

#### **Obtaining Initial Registered Location Information:**

Each of our VSPs can easily provision the Dash911 system using either the online webpage, the API or the telephone touch tone IVR system. The subscriber enters his Registered Location as part of the initial sign-up process when signing up for VoIP telephony service. The VSP can “bulk upload” the existing subscriber information using the API.

#### **Obtaining Updated Registered Location Information:**

Telefinity Dash 911, as part of our total 9-1-1 solution, provides at least one way of updating each subscriber's Registered Location. As a component of the Telefinity Dash911 Service we have access to a near real-time address update system provided to us by Telefinity Dash911. This allows us to have near real-time delivery of the subscriber's address and also allows us as a VSP to submit a subscriber's address update information directly. The system allows us to have the subscriber input his initial address into the system at the time of initially signing up for our VoIP service. Addresses submitted are subjected to an immediate screening against the US Postal Service Street Address Guide in order to immediately determine if the submitted address is a valid address. VSPs may integrate VUI into their existing provisioning systems to ensure seamless delivery of acquired registered location information to the Intrado systems.

Subscribers have more than one option to input, update or change their address. Subscribers can easily and quickly update their Registered Location by either (a) online via our website, or (b) use the Telefinity Dash911 telephone touch tone (IVR) system to either select another pre-registered address that the subscriber may already have on file, or to ask for an operator who will make the address change while the customer is on the phone.

At the time of an emergency VoIP 9-1-1 call, Telefinity Dash 911 passes the call directly to Intrado's call routing system. Intrado's call routing system uses the customer's provisioned information to associate the latitude and longitude assigned during provisioning with the wireline PSAP boundaries maintained by Intrado to determine appropriate PSAP for delivery of the MSAG Valid Address and Call Back Number of the user.

Telefinity Dash 911 also offers to us, as a VSP a newly-released product called “Level of Service (LoS) Query” that we can choose to integrate into our application. This functionality enables us to make a real-time query with an address of a customer/end user for the purpose of determining the level of 9-1-1 service available to that customer based on their location. Intrado will return a set of responses (Enhanced, Basic, etc.) that will enable us or our user to determine the level of 9-1-1 service available at that address and take appropriate action.

#### **Technical Solution for Nomadic Subscribers:**

A VSP using Telefinity Dash911's E911 for VoIP service is able to route VoIP emergency calls from the VoIP network to Telefinity Dash 911's Intrado Network or alternative 3rd party network for delivery to the appropriate Selective Router and then on to the

geographically appropriate Public Safety Answering Point (PSAP) via the native 9-1-1 infrastructure. The Services utilized provide a “native” 9-1-1 solution for routing VoIP 9-1-1 calls from both in-region and out-of-region telephone numbers (TNs) to the most geographically appropriate PSAP. The V9-1-1 solution enables full support of nomadic usage of VoIP provided the user updates their address information upon connecting to the Internet at a new location/address. Through the Telefinity Dash 911 interface, the 9-1-1 solution will enable the near real-time provisioning (Geocoding and MSAG Validation) of the newly-provisioned address and make available (assuming no errors) that particular user’s information for delivery to the PSAP within an average of 15 minutes of receipt of the new Registered Location address information.

We recognizes the universal desire to remove the user interaction and self-provisioning component of the current 9-1-1 solution. To that end Telefinity Dash 911, along with Intrado, are actively working a number of “location determination” technologies.
